AK5374

24-bit Stereo ADC with USB Interface

GENERAL DESCRIPTION

The AK5374 is a stereo A/D converter with a USB 2.0 interface. The device includes an integrated USB serial interface engine, a USB transceiver, an audio class processing block, endpoints, and a 24-bit stereo audio ADC. An integrated PLL enables the use of multiple sampling frequencies. A microphone amplifier and an integrated programmable gain amplifier are available for processing low-level signals from an analog microphone element. An external EEP-ROM is used to store the descriptor information. The AK5374 is housed in a 36-pin package. It is a low power device, operating from +3.3V, and consuming just 100mW in active mode and less than 100μA in suspend mode.

OPERATION OVERVIEW

■ Overview of AK5374

The AK5374 is a stereo A/D converter with USB interface. It is easy to use since the control logic including USB audio class, stereo differential microphone amplifiers, two PLL's USB serial interface engine, and FIFO are integrated. All Descriptor contents are stored in EEP-ROM and customizable. For example, when supporting a mono microphone by 48kHz sampling rate only, what needed to be done is to prepare appropriate USB descriptor. There is no need for writing program codes.

■ Clock Source

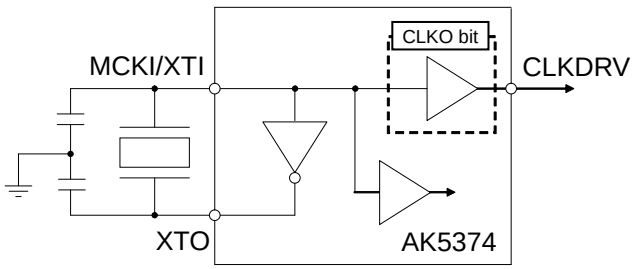

16MHz or 24 MHz crystal resonator can be used as the master clock. When the CKM pin is set to "H", the AK5374 supports 24MHz, and supports 16MHz when the CKM pin is set to "L". The AK5374 can drive the clock up to three external loads. The AK5374 generates 48MHz for system clock from 16MHz or 24MHz by system PLL circuit.

CKM pin	X'tal Frequency
L	16.0MHz
H	24.0MHz

Table 1. Reference X'tal frequency

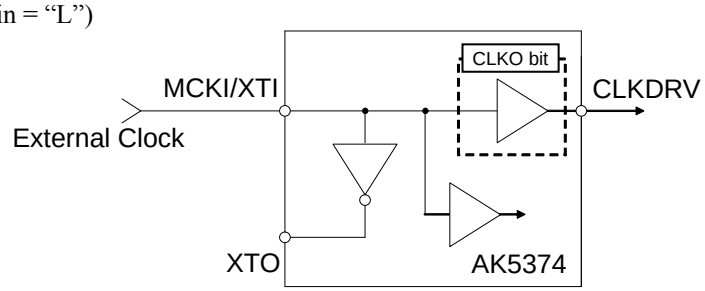

The clock for the MCKI/XTI pin can be generated by the following methods:

1) X'tal (XTE pin = "H")

Note 17. External capacitance depends on the crystal oscillator (Max. 30pF)
Figure 10. X'tal Mode

2) External clock (XTE pin = "L")

Note 18. Input clock must not exceed DVDD.
Figure 11. External clock mode

■ MIC Gain Amplifier

The AK5374 has a gain amplifier for microphone inputs. The gain of MIC-Amp is selected by the MGAIN2-0 bits (Table 2).

MGAIN2 bit	MGAIN1 bit	MGAIN0 bit	Input Gain
0	0	0	0dB
0	0	1	0dB
0	1	0	+6dB
0	1	1	+12dB

1	0	1	+24dB
1	1	0	+30dB
1	1	1	+36dB

Table 2. Mic Input Gain (x: Don't care)

■ MIC Power

When PMMP bit = "1", the MPWR pin supplies power for the microphone. This output voltage is typically 2.2V and the output current is maximum 2.0mA. In case of using two sets of stereo full-differential microphones, the load resistance is minimum 1kΩ for each channel. Any capacitor must not be connected directly to the MPWR pin (Figure 12).

PMMP bit	MPWR pin
0	Hi-Z
1	Output

Table 3. MIC Power

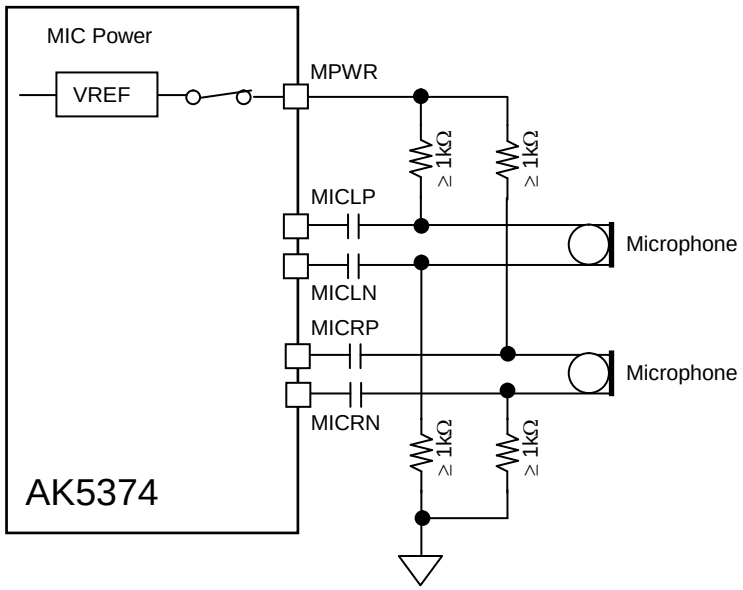

Figure 12. MIC Block Circuit

■ Digital High Pass Filter

The ADC has a digital high pass filter for DC offset cancellation. The cut-off frequency of the HPF is 0.93Hz at fs=48kHz. The digital high pass filter cut-off frequency scales with the sampling rate (fs). The HPF is always enabled.

■ Audio Data Format

The AK5374 supports 8bit, 16bit and 24bit audio data format and outputs LSB first to USB bus.

■ Volume & Mute Control

The AK5374 has a digital volume control which ranges from +24dB to -31dB in 1dB step. The maximum volume, the minimum and default volumes are defined by EEP-ROM header setting.

When ZCE bit = "1" (Zero cross detection enable), L-channel and R-channel volumes are changed independently on zero cross or zero cross timeout. Zero cross timeout is set by ZTM1-0 bits (Table 7). When ZCE bit = "0" (zero cross detection disable), the volume is changed immediately. Mute operation and zero cross detection have the same relation as the volume mentioned in this section.

ZTM1 bit	ZTM0 bit		Zero Crossing Timeout Period		
			8kHz	16kHz	44.1kHz
0	0	128/fs	16ms	8ms	2.9ms
0	1	256/fs	32ms	16ms	5.8ms
1	0	512/fs	64ms	32ms	11.6ms
1	1	1024/fs	128ms	64ms	23.2ms

Table 7. Zero Crossing Timeout Period

The AK3573 has the LMUTEN and RMUTEN pins. and they can control mute operations from the device side. However, because the AK5374 does not have HID function, the mute operation by these pins cannot be acknowledged by the host. There are two modes for the mute operation by LMUTEN and RMUTEN pins; one is normal mute and the other is one-shot mute.

In normal mute operation (OSME bit = "0"), mute is executed on zero cross or zero cross timeout when the LMUTEN and RMUTEN pins = "L" if zero cross detection is enabled. When zero cross detection is disabled, it is executed immediately. In case that the LMUTEN and RMUTEN pins = "H", mute is released on zero cross or zero cross timeout if the zero cross detection is enabled. When zero cross detection is disabled, it is released immediately.

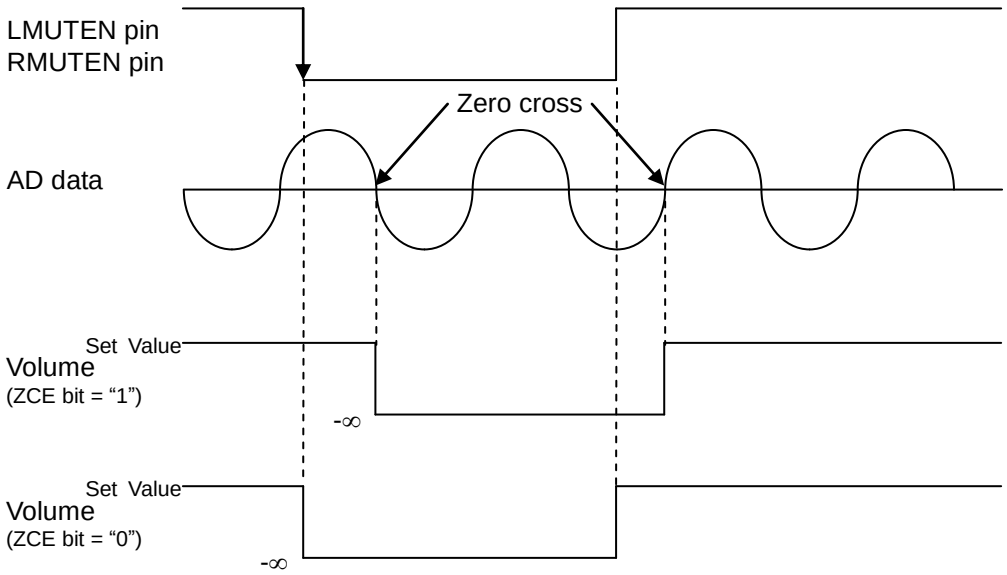

Figure 13. Normal Mute for LMUTEN, RMUTEN pins

In one-shot mute operation (OSME bit = "1"), mute is executed on zero cross or zero cross timeout after detecting a falling edge of the LMUTEN and RMUTEN pins. The AK5374 releases the mute on zero cross or zero cross timeout after mute hold period which is set by MHLD7-0 bits.

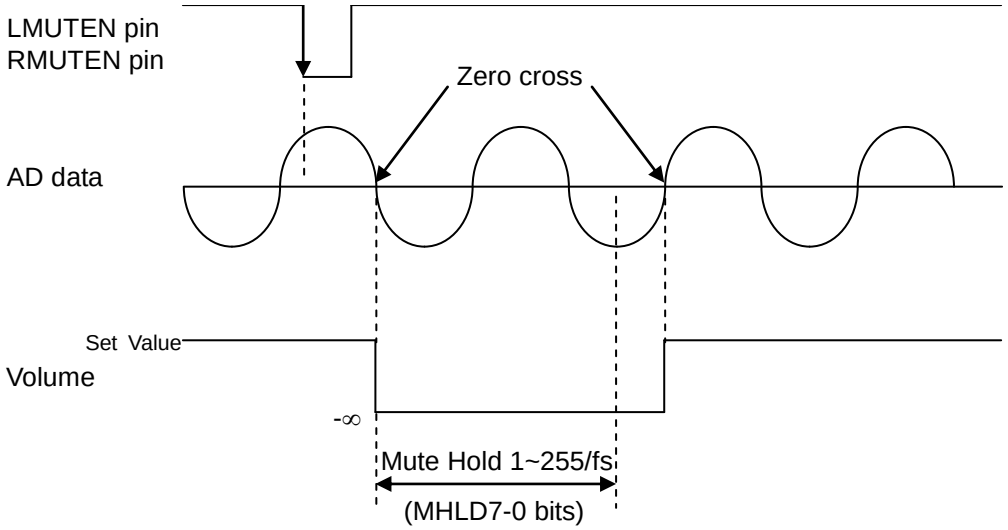

Figure 14. One Shot Mute for LMUTEN, RMUTEN pins

■ Power Management Control

USB specifies that the current at suspend mode must not exceed 500μA. When the USB host is in suspend mode, the SUSN pin also becomes to "L" in order to notify this mode to the external components like DSP's to observe USB specification.

■ Synchronization

The AK5374 supports synchronous type synchronization which is synchronous to SOF (start of frame) packets which are issued per 1ms.

■ Descriptor's Customization

USB audio class has very flexible, but complicated format. In order to keep both of the flexibility and simplicity to use, the AK5374 utilizes the precompiled control information in EEP-ROM instead of direct USB audio class decoding. Data in EEP-ROM is divided into two blocks; header information block and USB descriptor block. Header block size is fixed while USB descriptor block size is variable. Header information includes various control information such as audio format, the microphone's gain, power management information, and etc. When the device is powered up, at first the AK5374 reads the header block in EEP-ROM, and maps these values into the internal registers. Note that 8k bits or larger SPI type EEP-ROM is available.

The AK5374 does not store all of the descriptors into internal memory at the boot time. Instead, the AK5374 reads the descriptor from EEP-ROM and transmit it when it receives the "Get Descriptor" Request command. The AK5374 transmits NAK until it is ready to send data.

Header Information includes

1) Power Management Information
2) Microphone Gain
3) Mute Control Information
4) Descriptor related information
    a) PCM format(stereo/mono, resolution) and the related alternate setting number
    b) Endpoint number
    c) Initial/Minimum/Maximum Volume

■ EEP-ROM Control Interface

Register information and descriptor information on EEP-ROM are read by SPI I/F (CSN, SK, EPAO and EPAI) pins. The data on the I/F consists of Instruction Byte, Address Byte (MSB first, 16bits) and Input Data Byte (MSB first, 8bits). The AK5374 outputs Instruction Byte and Address Byte on a falling edge of SK and down-loads address data from EPAI. The next address data is read by sending SK signal continuously. Data reading ends by a rising edge of CSN. SK clock speed is typically 1.5MHz. The AK5374 reads data from EEP-ROM according to a request signal from the USB host after releasing a reset.

SYSTEM DESIGN

Figure 18 shows the system connection diagram. An evaluation board (AKD5374) is available for fast evaluation as well as suggestions for peripheral circuitry.

Notes:

- "C" and "Rd" values are dependent on the crystal. When the 24MHz crystal oscillator is used (CKM pin = "H"), AT-41-24.000M-LN-N-0005 (Nihon Dempa Kogyo) or HC49SFNB24000H0PESZ1 (Kyocera) is recommended. When the 16MHz crystal oscillator is used (CKM pin = "L"), AT-41-16.000M-LN-N-0005 (Nihon Dempa Kogyo) or HC49SFNB16000H0PESZ1 (Kyocera) is recommended.
- VSS1-3 must be connected the same ground plane.
- All digital input pins must not be left floating.

Figure 18. System Connection Diagram

1. Grounding and Power Supply Decoupling

The AK5374 requires careful attention to power supply and grounding arrangements. AVDD and DVDD are usually supplied from the system's analog supply. If AVDD and DVDD are supplied separately, the power-up sequence is not critical. VSS1-3 of the AK5374 must be connected to the analog ground plane. System analog ground and digital ground must be connected together near to where the supplies are brought onto the printed circuit board. Decoupling capacitors must be as near to the AK5374 as possible, with the small value ceramic capacitor being the nearest.

2. Voltage Reference

The voltage of VREF is 2.2V (typ) and set the analog input range. VCOM is 50%VREF and a signal ground of this chip. A 4.7μF electrolytic capacitor in parallel with a 0.1μF ceramic capacitor attached to the VREF pin and the VCOM pin eliminates the effects of high frequency noise. No load current may be drawn from the VREF pin and the VCOM pin. All signals, especially clocks, should be kept away from the VREF pin and the VCOM pin in order to avoid unwanted coupling into the AK5374.

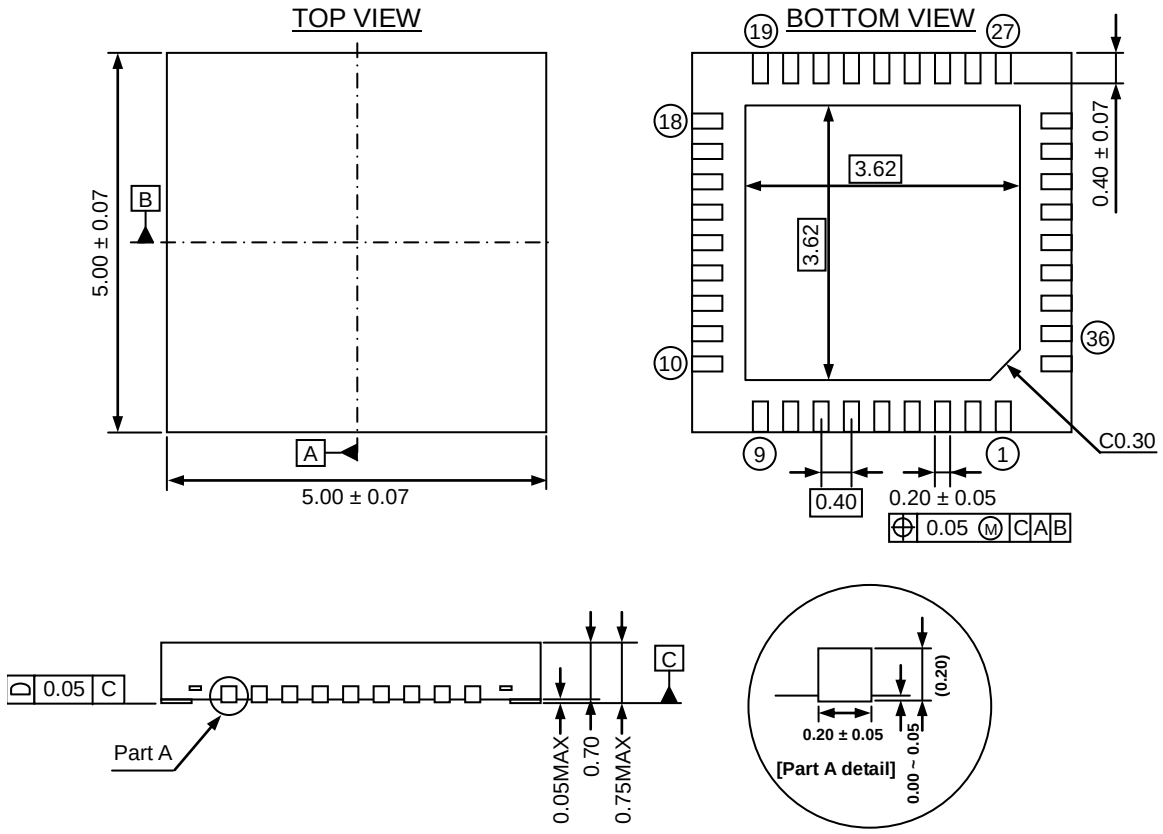

3. Analog Inputs

The analog inputs are full-differential and input resistance is 20kΩ (typ). The input signal range is typ. ±0.038Vpp (@MGAIN = +30dB) and typ. ±1.2Vpp (@MGAIN = 0dB), centered around the internal common voltage (typ. 1.1V). Usually the input signal is AC coupled using a capacitor. The cut-off frequency is fc = 1/ (2πRC). The DC offset including the ADC's own DC offset is removed by the internal HPF (fc=0.93Hz@fs=48kHz). The AK5374 can accept input voltages from VSS1 to VREF.
